

PMMC

PRODUCTION MODE MULTI COLOR

The ACMS™ Module PMMC serves to support the evaluation process. After determining a standard, the PMMC helps to create a reproduction. The subsequent release is carried out based on a defined similarity index.

The similarity index is a ratio developed and patented by IPAC used to describe the similarity of two samples (in percentage terms).

The print works identification generates correction measures based on L*, C* and h° values for each printed medium, successfully reducing the number of required evaluation steps.

The module offers extensive documentation possibilities: the accumulation of job data, manufacturing data and machine parameters as well as the gathering of correction data.

The recording of the complete finalized evaluation process ensures the identification of deviations along with the consistent traceability of the individual evaluation steps.
