

CMMC CERTIFICATION MODE MULTI COLOR

The ACMS™ Module CMMC is used to create an ACMS™ certificate for decorative patterns. The production release and / or the production itself is certified based on the similarity index.

The similarity index is a ratio developed and patented by IPAC used to describe the similarity of two samples (in percentage terms).

The value table shows the individual L^* , a^* , b^* , C^* , h° certification and contrast values.

This leads to an objective production assessment. In addition, physical samples indispensable for the visual evaluation, which without the existence of ACMSTM certificates would have had to be sent to the respective customer, are no longer necessary.

By the use of CMMC-generated information combined with the creation of the certificate, allows for the considerable improvement of the cooperation between different value creation levels with regard to reliability, quality and efficiency.
